

1. General comments.

- **Drop-down lists:** The text for the emission sources is truncated, preventing you from seeing the full option before selecting it. The suggestion here is to use a lower size for the font or a larger box containing the options. We could also hide the “biogenica” tag. It’s not relevant to be shown here. Please, when a scope is selected only show the elements that belong to that scope.
Separate by category and subcategory or include a navigation aid within the dropdown list.

The screenshot shows a web interface with a button labeled "Agregar fuente" (Add source). Below it is a search bar with the placeholder text "Buscar elemento...". A dropdown menu is open, displaying a list of items. Each item is truncated on the left side, showing only "A1: Incineración controlada de res...". To the right of each truncated text, there are two tags: "Biogénica" and "kg húmedo". The dropdown menu has a light gray background and a thin border.

- **GWP nomenclature:** We suggest changing "Conjunto GWP " to "Fuente GWP," including the IPCC report reference (e.g., AR4, AR5, or AR6).
Also please reorder this way:
Factor aplicado.
Fuente del factor.
Fuente GWP.

- **User guide:**
 - Please note that the platform requires the entry of consolidated totals by year and location (e.g., if 1,000 gallons of diesel were purchased for vehicle A and 2,000 gallons for vehicle B, a single entry of 3,000 gallons should be registered for that location). If possible, also include this note in the app.
 - Add a note reminding the user to verify the unit requested in each field before entering the data (kg, lb, km, gal, cc, etc.).
- **Gas Classification:** We'd like to check why are "HCFC-22 / R-22" and "Fugas de Propano Alta Calidad / R-290" shown on a separated group.

2. "Buenas prácticas" section.

- **Dynamic filter:** When a scope is selected (e.g., Scope 1), the section should only display options belonging to that specific scope.
- **Field adjustment:** We propose removing the "Category" and "Subcategory" fields and renaming the "Element" field to "Reportable Best Practice." This simplifies registration for users unfamiliar with the internal hierarchy of reporting sources. So here, user will only fill Scope, Element, Value and unit. These data will be in a separated table even in both summary and report.
- **Description.** Please leave a little description such as "Por favor, describe tus buenas prácticas aquí".

3. Data by "alcance".

- **Scope 2.** Rename the source name to "*Electricidad (Sistema Interconectado Nacional - SIN)*".
- **Scope 3.** Here we have the BIGGEST CHANGE on the tool.
 - *Categoría 6 (Viajes de negocios - Subsidios de transporte).* Here the thing Will work this way:

User will register the element in COP.

We'll have an extra table with the average price per gallon in COP (by year).

Tool will divide reported element by the price to get the total gallons.

Make the actual calculation to get tCO₂e value.

- *Categoría 6 (Viajes aéreos and Viaje terrestres).*
- *Categoría 7 (Desplazamiento de colaboradores).*

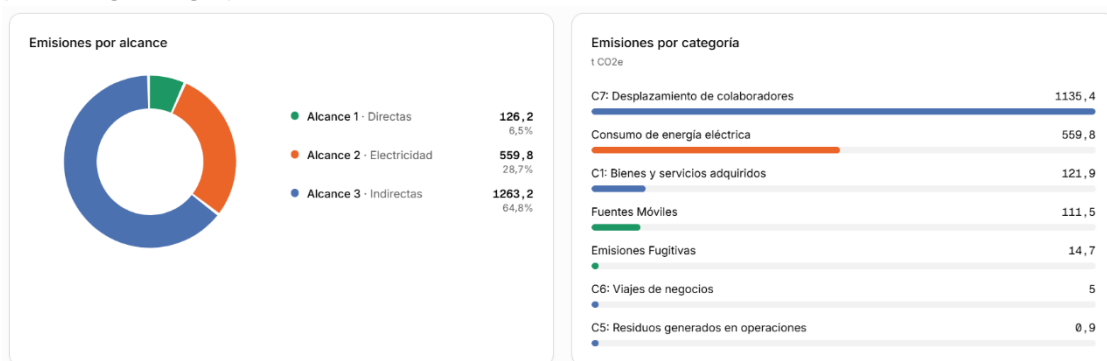

For these categories that are using the units “pasajeros*km” or “vehículo*km” user should be asked for two separated data. The user must report “pasajeros (or vehículos)” and separately “distance in km”.

Tool will multiply these two values to get the total value for final calculation.

4. Dashboard and reports.

- **Tags and units:**

- Include the units, for example tCO₂e in the graphs "Emisiones por alcance" and "Comparación entre años", the same way that units are in the “emisiones por categoría” graph.

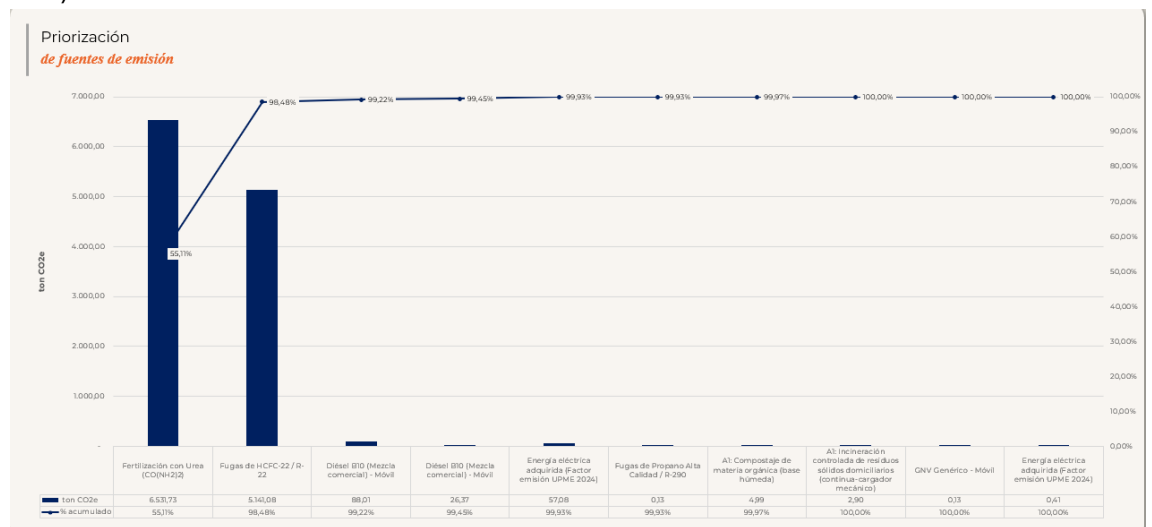

- "Rename "Emisiones por gas" as "**Emisiones por gas GEI**". Include % and total, same way as “emisiones por alcance” graph.
- Replace the text "huella total" with "**huella de carbono total**" in the first card.

- **Visualizations:**

- Include the Pareto chart for prioritizing emission sources (similar to the Excel tool).

- When filtering by scope (e.g., Scope 1 or Scope 3), the overall chart should no longer display all three scopes. Instead of “emisiones por alcance” chart, it should switch to two vertical bar chart (one bar per main category and one per main element within the scope) and include three summary cards: total for the scope, total for each main category, and emissions per main element. Check Excel tool for reference.
- Please check if it’s possible to filter selecting 2 scopes, not only one.
- For the “emisiones por gases” (old name) chart, please include all of the gases separately when reported. This means not only CO2, CH4, N2O and others but specify those “other” such SF6, NF3, etc.

- **Summary and reports:**

- In the "Summary" section, in addition to the breakdown by location, include a consolidated overview with all locations, this means a total for the whole company that year. (option not available).
- In the "Report" section, include the table for the consolidated declaration of GHG emissions under ISO 14064-1. This means that we should include a summary table by gas (CO2, CH4, N2O, SF6, NF3, etc).

- **“Emisiones biogénicas”:** Edit the final comment that only explains total “biogénicas” and the value, that’s it. Do not mention anything related to the

“memo item”.

Incluye 15,6 tCO₂e biogénicas, reportadas como memoria.
